Q1)

When browsing the internet, every time a user visits a new webpage, it is added to the browser history. When the user clicks the Back button, the browser returns to the previously visited page by removing the current page from the history.

Develop a simple browser navigation system using an array-based stack. Get the inputs from the user.

Tasks

Create a class named Webpage_Stack using a fixed-size array to store webpage URLs.

Implement the following methods:

push(String url) – Adds a newly visited webpage to the browser history.
pop() – Removes and returns the current webpage.
peek() – Returns the current webpage without removing it.
isEmpty() – Returns true if the stack is empty.
isFull() – Returns true if the stack is full.

The browser history can store a maximum of 10 webpages.
